

PROPOSAL FOR

AI-Powered Email Outreach Application

Modular disclosure outreach · human approval · reply tracking · 14-day follow-up

PREPARED FOR

Charly Suter · KMU Digitalisierung

ENGAGEMENT TYPE

Fixed-price · phased milestones · full code ownership

RECOMMENDED START

Milestone 1 (M1) — \$950 · 7–9 working days

FULL SPECIFICATION

4 milestones · \$3,450 total · ~4 weeks elapsed

EXECUTIVE SUMMARY

This proposal defines a production-grade outreach platform aligned with your job specification: import contacts, generate AI-personalised emails, require human review before every send, monitor replies, automate 14-day follow-ups, and manage multiple campaigns from one dashboard. Delivery is structured in four fixed-price milestones so you fund incrementally, validate each phase, and retain full ownership of source code and infrastructure. An interactive demo is included to validate the approval workflow before development begins.

M1

Working app in ~1 week

100%

Human approval before send

4

Phased milestones

CH/EU

Compliance-aware design

Supporting materials · Demo: ainoafv.github.io/ai-outreach-hitl-demo · Web proposal: [.../proposal.html](#)

1. Business objective

Replace manual, error-prone outreach with a **controlled automation pipeline**: your team retains editorial control over every outbound message while AI handles personalisation at scale. The system is designed for long-term reuse — new campaigns, audiences, and disclosure topics without rebuilding from scratch.

2. Scope alignment

Requirement (your brief)	Proposed solution	Phase
Contact import (CSV / data sources)	CSV upload with column mapping; REST import hook in final phase	M1
AI-personalised outreach emails	Claude / OpenAI · structured JSON output · per-campaign prompts	M1
Review, edit, approve before send	Next.js approval dashboard (see interactive demo)	M1
Automated send (approved only)	n8n send queue → SMTP / Gmail API	M1
Inbound reply monitoring	IMAP / webhook parser → status <i>Replied</i>	M2
14-day follow-up if no reply	Scheduler · AI follow-up draft · approval gate · send	M2
Multi-campaign dashboard	Campaign manager · KPIs · status board (Draft / Sent / Replied)	M3
Enrichment & extensibility	CSV fields + optional website fetch · plugin architecture	M4
Source code, docs, deployment	Repository handoff · Docker · runbook · Loom training	M4

Budget note: The posted \$400 fixed budget covers approximately 10 hours of senior engineering — insufficient for a maintainable production application (~80–120 h for the full spec). This proposal offers a **phased entry at M1 (\$950)** instead of a low-quality template that would fail under real campaign load.

How the platform works

From contact import to follow-up — with mandatory human gates

3.1 Technology stack

Layer	Technology	Rationale
Automation	n8n	Matches your spec; visual workflows; cron + webhooks
AI	Claude Sonnet	Long-context personalisation; OpenAI fallback optional
Backend	FastAPI	LLM orchestration, state machine, enrichment plugins
Database	PostgreSQL	Campaigns, contacts, audit — ACID compliance
Frontend	Next.js	Approval dashboard; DE labels available from M3
Email	SMTP / Gmail	Your credentials; no vendor lock-in
Deploy	Docker	Your VPS / AWS — you own infrastructure

3.2 Compliance (Switzerland / EU)

- **Human-in-the-loop default** — no message sends without explicit approval
- **No LinkedIn scraping** — platform ToS and nDSG/GDPR exposure
- **Enrichment scope** — CSV fields + optional public website text only
- **Full audit trail** — exportable log per contact and campaign
- **Data residency** — deployed on infrastructure you control

3.3 Why this architecture

Separating the **approval UI** (Next.js), **business logic** (FastAPI), and **automation layer** (n8n) means your team can maintain workflows visually while developers extend enrichment and AI prompts without touching send infrastructure.

Fixed-price milestones

Fund incrementally · sign off per phase · stop anytime

M1 · RECOMMENDED \$950 7–9 working days CSV · AI drafts · approval UI · SMTP send · PostgreSQL · staging deploy	M2 \$900 6–8 days Inbound reply detection · 14-day follow-up · scheduler	M3 \$850 5–7 days Multi-campaign · dashboard KPIs · n8n workflow export	M4 \$750 4–6 days Website enrichment · plugins · source handoff · runbook
--	---	--	--

Phase	Investment	Duration	Key deliverables
M1 — Core outreach loop	\$950	7–9 days	CSV import · 1 campaign · Claude drafts · approval dashboard · SMTP (approved-only) · DB · staging · documentation
M2 — Reply & follow-up	\$900	6–8 days	Inbound parser · <i>Replied</i> status · 14-day follow-up generator · second approval gate · cron scheduler
M3 — Scale & visibility	\$850	5–7 days	Multiple campaigns · prompt templates · status dashboard · campaign KPIs · n8n export
M4 — Enrichment & handoff	\$750	4–6 days	Company URL enrichment · modular plugins · full repo transfer · Docker runbook · Loom training
Total (full job specification)		~4 weeks	\$3,450 fixed · 100% code ownership · no recurring licence to developer

Recommendation: Commence with **M1 (\$950)**. You receive a production-ready tool your team can use immediately. M2–M4 are funded only after written sign-off on the prior milestone. No upfront commitment to the full \$3,450 is required.

4.1 M1 acceptance criteria (sign-off checklist)

#	Criterion	Definition of done
1	Contact import	≥ 50 contacts imported via CSV with correct column mapping
2	AI generation	Claude produces subject line + body from contact data + campaign prompt
3	Approval gate	System blocks send for any email not explicitly approved
4	Delivery	Approved email successfully delivered via your SMTP/Gmail on staging
5	Audit log	All actions recorded with timestamp, user, and status transition
6	Handoff	Git repository · environment documentation · 5-minute Loom walkthrough

4.2 Alternative engagement model

Hourly with cap: \$42/hr, maximum \$3,800, structured against the same milestones above. Suitable if you prefer weekly progress visibility over fixed-price blocks.

M1 delivery schedule

From contract start to staging handoff

Period	Activities	Output
Days 1–2	Database schema · CSV import · campaign & prompt model · Claude integration v1	Backend foundation
Days 3–5	Approval dashboard · edit flow · SMTP integration · staging environment	Working UI + send path
Days 6–7	End-to-end test (3 real contacts) · bug fixes · documentation · Loom handoff	M1 sign-off ready

5.1 Client inputs required

- Sample CSV (or anonymised export) with target columns
- 2–3 example emails that performed well historically
- SMTP/Gmail credentials (staging) + Claude or OpenAI API key
- Campaign guidelines: tone, disclosure rules, forbidden claims
- UI language preference: English v1, or German from M1?

5.2 Delivery model

- Async-first: written updates + Loom walkthroughs
- No standing calls required
- 100% source code ownership after each milestone
- All communication via Upwork for audit trail

5.3 Relevant experience

- Production outbound automation with mandatory human approval + audit (US B2B)
- CRM AI classification — structured JSON, reason codes, business rules
- Regulated AI pipelines (EU hospital) — fail-closed, nothing ships unapproved

Portfolio demo:
ainoafv.github.io/agent-engineering-demo

5.4 Proposed next steps

1. Review the interactive demo and confirm the approval workflow meets your expectations
2. Confirm M1 scope, budget (\$950), and preferred UI language
3. Create Upwork fixed-price contract for Milestone 1
4. Kick-off: share sample CSV, email examples, and API credentials
5. Receive staging deployment + M1 sign-off within 7–9 working days

RECOMMENDED ENGAGEMENT

Milestone 1 · \$950

Full specification available across M1–M4 · \$3,450 total
